

Powerful proactive protection for onions and potatoes

Zampro combines the power of two modes of action (MoA) to offer lasting disease control and stronger resistance management. The combination of ametoctradin (MoA group 45) and dimethomorph (MoA Group 40) attacks pathogens at multiple sites. The systemic action of dimethomorph interferes with normal cell wall deposition and is active at all stages in the fungal life cycle while the protectant action of ametoctradin strongly inhibits mitochondrial respiration and is very active against zoospores and zoosporangia.

- Class leading, non-EBDC fungicide with a unique mode of action for control of oomycete fungi.
- Innovative protectant action giving immediate knockdown of infectious zoospores, stopping disease spread.
- Translaminar and locally systemic activity maximises distribution within the treated area.
- Internationally accepted toxicological and environmental profiles.
- New MoA strengthening fungicide resistance management.

Active ingredients:

Ametoctradin 300 g/L
Dimethomorph 225 g/L

Crop registrations

Onions
Potatoes

Diseases controlled:

Onion downy mildew
Potato late blight

Withholding periods

Onions and potatoes: 14 days

How and when to use Zampro

Rate	800 mL/ha in 200 - 500 L water/ha
Method	Apply in a preventative programme, alternating with fungicides from other mode-of-action groups. To improve disease control, apply with a spreading/penetrating adjuvant.
Timing	Apply at 7-10 day intervals. Use shorter intervals in periods of heavy infection pressure.

Resistance management

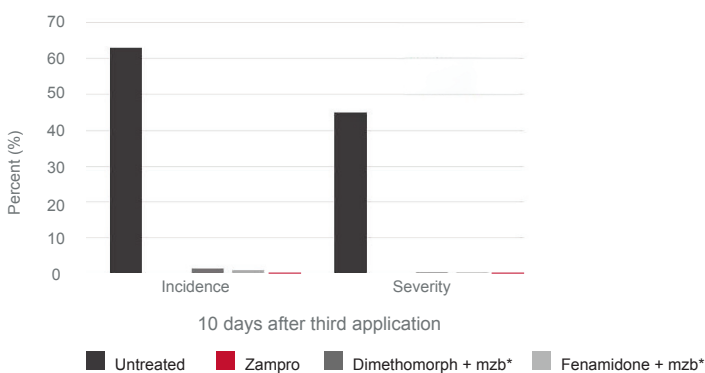

Make no more than four applications of Zampro per season. Do not make more than three consecutive applications of Zampro before alternating to a fungicide from a different mode-of-action group.

Late blight infection in potatoes after four fungicide applications
